LEADERSHIP IN RESEARCH AND DEVELOPMENT OF X-RAY TECHNIQUES

Science Lead, APS-U POLAR beamline (2015-Present): Led team of 15 scientists from U.S. academia and national labs in putting together the science case and related proposals for the new beamline POLAR as part of the APS-upgrade (APS-U) project. The new beamline will exploit the greatly enhanced brightness of the APS-U source, as well as novel concepts for production of polarized x-rays enabled by such source, to probe electronic correlations in quantum matter, particularly at extreme pressure conditions in the multi-Mbar range. Led writeup of functional requirements and preliminary design documents. Coordinated and steered efforts of POLAR core team towards final design of beamline layout including optics, enclosures, and instrumentation for end stations. Represents POLAR team at external reviews by DOE and technical and scientific advisory panels. Beamline is currently under construction, to become operational in 2024.

X-ray absorption spectroscopy at high pressures (2007-Present): Developed a high-pressure (1 Mbar), low-temperature (1.3 K), in-field (6.5 Tesla) capability for XANES/XMCD/XAFS studies of magnetic materials at extreme conditions. The instrument features a diamond-anvil cell with perforated anvils to minimize anvil's absorption, remote control of piston-motion via compression and decompression gas membranes allowing *in-situ* pressure control at low temperatures, and an online Ruby fluorescence system for *in-situ* pressure calibration at low temperatures. This effort, seeded by LDRD funding, nucleated a successful R&D and user program leading to over 50 publications since inception [*Phys. Rev. Lett.* 124, 067201 (2020); *Phys. Rev. Lett.* 121, 037004 (2018); *Phys. Rev. Lett.* 114, 077202 (2015); *Phys. Rev. Lett.* 109, 027204 (2012); *Phys. Rev. Lett.* 109, 026403 (2012); *Phys. Rev. Lett.* 100, 045508 (2008); *Phys. Rev. Lett.* 102, 057206 (2009)].

X-ray studies of element- and site-specific magnetism in single crystals (2003-2008): Exploited the symmetry properties of crystals in combination with resonant scattering of circularly polarized (CP) x-rays to develop a new method to obtain crystal-site-selective magnetic information in single crystals. This technique allowed measuring site-selective magnetization reversals in permanent magnetic materials providing an atomic look at the origins of magneto-crystalline anisotropy in best permanent magnet Nd₂Fe₁₄B [*Phys. Rev. Lett.* 95, 217207 (2005); *Phys. Rev. B* 73, 144416 (2006); *Phys. Rev. B* 74, 104114 (2006); *Appl. Phys. Lett.* 93, 052504 (2008)]. Developed a digital lock-in detection system for dichroic diffraction of CP x-rays (U.S. Patent 7,403,592 issued July 2008).

X-ray studies of interfacial magnetism (1999-2014): Combined x-ray resonant reflectivity with magnetic circular dichroism techniques to develop x-ray resonant magnetic reflectivity as a tool to measure and quantify the spatial extent and strength of magnetic exchange coupling at buried interfaces of layered structures. These techniques revealed the existence of induced Gd magnetization near the Gd/Fe interface and determined its spatial extent. Generalized computer codes were developed to retrieve magnetization density profiles from layered structures within the first Born approximation, and to obtain anomalous magnetic scattering factors from XMCD measurements [*Phys. Rev. Lett.* 87, 207201 (2001); *Phys. Rev. B* 70, 134420 (2004); *Appl. Phys. Lett.* 91, 022503 (2007); *App. Phys. Lett.* 92, 162502 (2008) *Phys. Rev. B* 79, 134438 (2009), *Phys. Rev. B* 92, 224433 (2015)].

Polarized XAFS studies of local structure in high T_c superconductors (1992-1999): Exploited the polarization dependence of X-ray Absorption Fine Structure (XAFS) in anisotropic layered structures of high T_c superconductors to measure local atomic arrangements at structural phase transitions and around dopant atoms with unprecedented accuracy. Developed methods for preparation of magnetically aligned powders for polarization-dependent fluorescence XAFS experiments. Developed XAFS data analysis tools leveraging multiple scattering effects to probe three-body correlations (bonding angles). These measurements revealed, among others, the partial order-disorder nature of the Sr-induced phase transition in La_{2-x}Sr_xCuO₄ [*Phys. Rev.*

Lett. **76**, 439 (1996)], the polaronic nature of hole carriers doped by Sr in $\text{La}_{2-x}\text{Sr}_x\text{CuO}_4$ [*Phys. Rev. B (Rapid Communications)* **56**, R521 (1997)], the high spin non Jahn-Teller state of Ni in $\text{La}_{2-x}\text{Sr}_x\text{Cu}_{1-y}\text{Ni}_y\text{O}_4$ [*Phys. Rev. B* **64**, 104510 (2001)] and the large local disorder in tilt angle of CuO_6 octahedra present in $\text{La}_{1.875}\text{Ba}_{0.125}\text{CuO}_4$ [*Phys. Rev. B* **61**, 7055 (2000)].

RESEARCH NON-X-RAY TECHNIQUES

Electron microscopy studies of local atomic structure of materials (1992-1995): Contributed to the development of the EXELFS technique (Extended Energy Loss Fine Structure) as a structural tool with high spatial resolution (50Å -1μm) in the Transmission Electron Microscope (TEM). Main contributions include improvements in data analysis and quantifying the effect of electron radiation damage as a limitation to high spatial resolution [*Micron* **30**, 185-194 (1999), *Ultramicroscopy* **58** n.3-4 p.353 (1995)].

Mössbauer-effect studies of impurities in metals (1989-1992): Used Mössbauer spectroscopy on the ^{119}Sn isotope to study local dynamics and electronic properties of Sn impurities in Ag, Pb and Au metal hosts. Unusually large dynamics of Sn atoms was found at high temperatures, providing new clues into the role of point defects on lowering the melting temperature of dilute binary alloys [*Phys. Rev. B* **47**, 14032 (1993), *J. Phys. Cond. Matt.* **10**, 8573 (1998)].
